

TugOnn Students Frontend v2 — Test Execution Report (v2, full)

Build under test: <https://tug-onn-students-front-end-v2.vercel.app> **Testing type:** Smoke testing (automated, Playwright + pytest) **Date:** 07.08.2026 **Environment:** Chromium 151.0.7922.34, Windows 11, desktop 1440x900, mobile 390x844 **QA:** Valentyna Sotnichuk

Supersedes the first version of this report.

Execution summary

Status	Count
Passed	30
Failed (confirmed defects)	15
Expected to fail (xfail, known defect)	2
Failed due to a defect in the test	4
Not executed	6
Total	57

Pass rate on executed product checks: 30 of 47, or 64%.

PASSED — Home page

Test	What it verifies
test_page_returns_200	Served with HTTP 200, no deployment protection blocking access
test_html_has_lang	The html element carries a lang attribute

Test	What it verifies
test_no_localhost_in_page	No localhost references leaked into production markup
test_no_console_errors	No JavaScript errors, page errors or failed requests
test_no_broken_images	Every image loaded successfully
test_images_have_alt	Every image carries an alt attribute
test_no_text_cursor_on_non_input_elements	No text cursor on elements that are not input fields
test_no_unexpected_contenteditable	No element outside form inputs is editable in the DOM
test_focus_is_visible	The focused element has a visible focus style after Tab
test_popover_opens_and_closes_by_escape	The popover opens on click and closes on Escape
test_navigation_works_on_mobile	Navigation elements remain visible at 390x844

test_no_localhost_in_page deserves a note. A previously reported critical defect on this project had the frontend pointing to `localhost:4000` in production. This check was written as a regression guard and passes on the current build.

PASSED — Navigation and browser history

Test	What it verifies
test_no_empty_links	No links with href="#" or an empty target
test_all_internal_links_return_2xx	Every internal link resolves without 4xx or 5xx
test_back_button_exists_on_inner_pages	Inner pages provide a visible way back

Test	What it verifies
test_logo_leads_home	The header logo returns the user to the home page
test_forward_after_back_works	Browser Forward restores the page after Back
test_direct_url_access_works	Inner pages open by direct URL, not only via in-app clicks
test_404_page_is_handled	A non-existent route returns 404 with a readable message and a link home

test_direct_url_access_works is worth flagging as a positive. Client-side routed applications commonly break here, rendering a page only when reached from inside the app. This build handles it correctly.

PASSED — Manage Communities

Test	What it verifies
test_page_opens	Served with HTTP 200
test_all_tabs_present	All five tabs are rendered
test_tabs_change_content	Switching a tab genuinely rebuilds the list
test_community_names_are_real_links	Community names are real links, not styled divs
test_no_contenteditable	Nothing outside form inputs is editable
test_tabs_are_keyboard_accessible	All five tabs are reachable in the tab order
test_focus_is_visible	Visible focus style after Tab
test_search_field_accepts_input	The search field accepts and retains typed text
test_no_horizontal_scroll_mobile	No horizontal overflow at 390x844

Test	What it verifies
test_tabs_reachable_on_mobile	All five tabs remain visible on a narrow screen

Two of these matter as contrast against home-page failures. The tabs here are keyboard accessible while the feed scope switcher on the home page is not (BUG-008), and this page has no horizontal overflow while the home page overflows by 292px (BUG-015). In both cases the correct pattern already exists in the codebase.

FAILED — confirmed defects

Test	Page	Defect
test_title_is_not_default	Home	BUG-004
test_meta_description_is_not_default	Home	BUG-005
test_single_h1	Home	BUG-006
test_clickable_elements_have_pointer_cursor	Home	BUG-009
test_all_buttons_are_keyboard_reachable	Home	BUG-008
test_buttons_have_accessible_name	Home	BUG-007
test_tabs_switch_content	Home	BUG-002
test_no_horizontal_scroll_mobile	Home	BUG-015
test_tap_targets_at_least_44px	Home	BUG-016
test_back_button_returns_to_previous_tab	/manage-community	BUG-003

Test	Page	Defect
test_clickable_have_pointer_cursor	/manage-community	BUG-009
test_buttons_have_accessible_name	/manage-community	BUG-007
test_back_arrow_works	/manage-community	BUG-011
test_search_filters_the_list	/manage-community	BUG-013
test_filters_are_real_dropdowns	/manage-community	BUG-014
test_action_buttons_are_44px	/manage-community	BUG-017

BUG-001 was found manually with console inspection and is not currently covered by an automated check. Adding one is listed under next steps.

XFAIL — known defects, expected to fail

Test	Defect
test_active_tab_is_reflected_in_url	BUG-003
test_tab_survives_reload	BUG-003

Marked **xfail** so a known open defect does not turn the run red. When fixed they report **XPASS**, which acts as an automatic signal that the ticket can be verified and closed.

Failures caused by the test, not the product

Reported openly, because an automated suite is only useful if its failures are trustworthy.

Test	Cause	Resolution
test_click_every_link_and_go_back	Treated the logo link to / as a navigation failure and clicked a non-visible duplicate of the Manage Communities link. Manual verification confirmed the URL changes correctly.	Corrected — root links skipped, only visible elements clicked, and the assertion now checks the URL matches the href rather than merely changing.
test_community_names_are_clickable	Flagged span, path and circle elements inside event cards, which correctly inherit <code>cursor: pointer</code> from the parent card.	Narrowed to heading elements; the rewritten version passes on /manage-community.
test_tabs_are_keyboard_accessible	Crashed with <code>Cannot read properties of undefined (reading 'trim')</code> on SVG elements, which have no <code>innerText</code> .	Fixed with a null guard; now passes.
test_category_dropdown_opens / test_sort_dropdown_opens	Timed out waiting for text that does not exist in the DOM.	Investigating the timeout led directly to BUG-014 — the controls are text inputs, not dropdowns. Rewritten as <code>test_filters_are_real_dropdowns</code> , which now asserts the correct thing and fails against the real defect.

The last row is worth highlighting to the team: a test failing for an unexpected reason was what surfaced BUG-014. The controls looked like dropdowns in the UI and only DOM inspection revealed they are plain text inputs.

Not executed

Written but not yet run against this build:

test_upcoming_events_are_in_the_future (O-3), test_no_duplicate_events (O-4), test_post_relative_time_matches_absolute_date (O-5), test_no_placeholder_text, test_no_raw_undefined_or_nan, test_content_not_from_external_cdn (O-1)

These are content checks and were deferred because the underlying data appears to be mocked. They should be run once real backend data is connected.

Conclusion

The build is **not ready for release**.

Four core user flows are non-functional while appearing operational in the interface: creating a post (BUG-001), filtering the feed by scope (BUG-002), searching communities (BUG-013), and filtering or sorting communities (BUG-014). In every case the control accepts input and responds visually, but nothing happens. This is more damaging than a visibly broken control, because the user receives no signal that their action had no effect.

A fifth issue, 292px of horizontal overflow (BUG-015), makes the home page difficult to use on a phone.

Structural quality is otherwise reasonable for a first deployment. Routing, browser history, direct URL access and 404 handling behave correctly, the console is clean, no assets fail to load, and the Manage Communities page is both keyboard accessible and responsive. Several of the home-page failures have a correct counterpart on the second page, which suggests the fixes are known patterns rather than new work.

Recommended process change: wire this suite into the Vercel deployment pipeline. A full run takes under two minutes and would have caught the default metadata, the missing H1, the keyboard accessibility gaps and the mobile overflow before the build was handed over for testing.

Recommended next steps for the suite:

1. Add an automated check for BUG-001 that intercepts the network request on Post submission
2. Cover Join / Leave state changes and the "Showing X-Y of Z" counter against the actual card count
3. Cover pagination behaviour (O-6)
4. Run the deferred content checks once real backend data is connected
5. Add a second browser (Firefox or WebKit) to catch engine-specific issues
