

TugOnn Students Frontend v2 — Bug Report (v2, full)

Build under test: <https://tug-onn-students-front-end-v2.vercel.app> **Testing type:** Smoke testing (manual + automated) **Date:** 07.08.2026 **Environment:** Chromium 151.0.7922.34, Windows 11, desktop 1440x900, mobile 390x844 **Automation:** Python 3.14, Playwright 1.62, pytest 9.1 **QA:** Valentyna Sotnichuk

Supersedes the first version of this report. Bugs BUG-011 to BUG-017 are new.

Summary

Priority	Count
High	5
Medium	9
Low	2
Total defects	16
Observations pending confirmation	6

Pages covered: Home feed, Manage Communities **Areas covered:** smoke, metadata, navigation and browser history, cursor and hover states, keyboard accessibility, accessible names, search and filters, mobile viewport **Not covered:** authentication, community detail pages, event detail pages, post interactions (like, comment, share), pagination behaviour, other viewports

HIGH

BUG-001 — Created post is not saved and does not appear in the feed

Page: Home | **Responsibility:** FRONT (BACK if the endpoint is missing)

Steps to reproduce:

1. Open the home page
2. Scroll to the Posts section
3. Type any text into the "What is in your mind?.." field
4. Click Post
5. Observe the feed and the browser console
6. Reload the page (F5)

Expected: The post is saved and appears in the feed immediately. The user gets visible confirmation. The community selected in "Choose a community" is submitted with the rest of the data.

Real: The input field clears, signalling success, but no post is added. After a reload the post is still absent, so it was never persisted. No success or error message. The console prints the payload instead of sending it.

Evidence:

Submitting post: Object

innerFeed: "Circle"

location: "Local"

outerFeed: "All"

text: "ппрорирингмнемеае"

The payload contains no community identifier despite the dropdown existing in the UI. `console.log` with user post content must not ship to production. Clearing the form without persisting is worse than doing nothing — the user believes the post was published and the typed text is lost.

BUG-002 — Feed scope filters Local / Nation / World do not change the feed

Page: Home | **Responsibility:** FRONT (BACK if scope is unsupported)

Steps to reproduce:

1. Open the home page
2. Note the posts currently in the feed
3. Click Nation
4. Click World
5. Compare the feed after each switch

Expected: Each filter shows posts of the corresponding scope; the feed rebuilds.

Real: The switcher changes state visually, but the post list is identical for All, Circle, Local, Nation and World. The URL does not change either.

Evidence: `test_tabs_switch_content` — page text byte-identical before and after each switch. Please confirm whether scope filtering exists on the backend. If not, track as unfinished feature rather than defect.

BUG-013 — Community search does not filter the list

Page: /manage-community | **Responsibility:** FRONT

Steps to reproduce:

1. Open /manage-community
2. Type "Photography" into the Search communities field
3. Wait for the list to update

Expected: Only matching communities are shown; the counter updates.

Real: The list is unchanged, all 6 communities remain, the counter still reads "Showing 1-6 of 6 communities". The field accepts input correctly, so the problem is in the filtering logic, not the control.

Evidence: `test_search_field_accepts_input` PASSED,
`test_search_filters_the_list` FAILED with identical page text before and after.

BUG-014 — Category and sort controls are plain text inputs styled as dropdowns

Page: /manage-community | **Responsibility:** FRONT

Steps to reproduce:

1. Open /manage-community
2. Click "All categories"
3. Click "Most popular"
4. Inspect both elements in DevTools

Expected: Both open a list of options and filter or sort the list when an option is chosen.

Real: Both are `<input>` elements using the label as placeholder text. There is no select, no `role="combobox"`, no `role="listbox"` and no option list anywhere in the DOM. Clicking only focuses a text field. The chevron icon is decorative and misleads the user into expecting a dropdown.

Evidence:

SELECT elements: []

INPUTS:

```
{'placeholder': 'Search communities, events, people...'}
```

```
{'placeholder': 'Search communities'}
```

```
{'placeholder': 'All categories'}
```

```
{'placeholder': 'Most popular'}
```

This looks like unimplemented functionality rather than a styling defect. Please confirm whether it is planned for this phase.

BUG-012 was opened as "filters appear inactive" and is merged into this ticket. The number is retired.

BUG-015 — Horizontal overflow of 292px on mobile

Page: Home | **Responsibility:** FRONT

Steps to reproduce:

1. Open the home page at viewport 390x844

Expected: Content fits the viewport width, no horizontal scrolling.

Real: `document.scrollWidth` exceeds `clientWidth` by 292px — roughly 75% of the screen width. The page scrolls sideways and part of the interface is cut off.

Evidence: `test_no_horizontal_scroll_mobile`, overflow 292px. Note: `/manage-community` passes the same check, so the problem is local to the home page rather than global. Likely candidates are the Special Section cards or the Upcoming Events carousel with a fixed width and no container constraint.

MEDIUM

BUG-003 — Active tab state on Manage Communities is not in the URL or browser history

Page: `/manage-community` | **Responsibility:** FRONT

Steps to reproduce:

1. Open the home page
2. Click Manage Communities
3. Switch to My Communities
4. Check the address bar
5. Press F5
6. Return to My Communities and press the browser Back button

Expected: The active tab is reflected in the URL (e.g. `?tab=my-communities`), survives a reload, and Back returns to the previous tab. A link to a specific tab can be shared.

Real:

- Step 4: URL stays `/manage-community` for every tab
- Step 5: after reload the tab resets to All Communities
- Step 6: Back navigates to the home feed instead of the previous tab

Evidence: `test_active_tab_is_reflected_in_url`, `test_tab_survives_reload`, `test_back_button_returns_to_previous_tab`.

BUG-004 — Default Next.js page title

Page: Home | **Responsibility:** FRONT

Steps: Open the home page and look at the browser tab label. **Expected:** The product name, e.g. "TugOnn". **Real:** "Create Next App" — the scaffolding default. The same value appears in search results, bookmarks and shared links. **Evidence:** `test_title_is_not_default`.

BUG-005 — Default Next.js meta description

Page: Home | **Responsibility:** FRONT

Steps: Open the page source and locate `<meta name="description">`. **Expected:** A meaningful product description for search engines and link previews. **Real:** "Generated by create next app". **Evidence:** `test_meta_description_is_not_default`. Fixed in the same place as BUG-004 (the `metadata` export in the root layout); may be merged.

BUG-006 — Home page has no H1 heading

Page: Home | **Responsibility:** FRONT

Steps: Open the home page and inspect the heading structure. **Expected:** Exactly one H1 describing the page, with the rest forming a correct hierarchy below it. **Real:** No H1 at all; the hierarchy starts at H2 (Upcoming Events, Posts). **Evidence:** `test_single_h1` — found 0. Screen readers use H1 as the entry point of a page. Also affects SEO.

BUG-007 — Icon-only buttons have no accessible name

Page: Home, /manage-community | **Responsibility:** FRONT

Steps: Inspect icon-only buttons — card close buttons, carousel arrows, post menu, the back arrow and sort control in the communities header row. **Expected:** Every icon-only button exposes a name via `aria-label`, `title` or image `alt`. **Real:** 11 such buttons on the home page and 2 on /manage-community have no text, no aria-label, no title and no image alt. A screen reader announces them only as "button". **Evidence:** `test_buttons_have_accessible_name` on both pages. WCAG 2.1 Level A, SC 4.1.2 Name, Role, Value.

BUG-008 — Feed scope buttons are not reachable by keyboard

Page: Home | **Responsibility:** FRONT

Steps: Press Tab repeatedly and try to reach Local, Nation, World and the event carousel arrows. **Expected:** All interactive controls are in the tab order and activate with Enter or Space. **Real:** Local, Nation, World and "Scroll to previous events" have a negative `tabIndex` and are skipped entirely. A keyboard-only user cannot change the feed scope. **Evidence:** `test_all_buttons_are_keyboard_reachable`. WCAG 2.1 Level A, SC 2.1.1 Keyboard. Note: the tabs on /manage-community pass the equivalent check, so the pattern is correct elsewhere in the codebase.

BUG-011 — Back arrow on Manage Communities does nothing

Page: /manage-community | **Responsibility:** FRONT

Steps: Open /manage-community and click the back arrow to the left of the "All communities" field. **Expected:** Navigates back to the previous page or to the home feed. **Real:** Nothing happens; the URL is unchanged and the user stays on the same page. **Evidence:** `test_back_arrow_works`, URL identical before and after the click. Confirmed manually. Combined with BUG-003 this traps the user: the visible back control does nothing and the browser Back button goes to the wrong place.

BUG-016 — Tap targets below 44x44 on mobile

Page: Home | **Responsibility:** FRONT

Steps: Open the home page at viewport 390x844 and inspect interactive element sizes.

Expected: At least 44x44 CSS pixels (Apple HIG) or 48x48 dp (Material). **Real:** Over 20 elements fall below the minimum, including a 28x28 icon button, comment counters at 105x18, and the "Events +2" chip at 80x23. **Evidence:** `test_tap_targets_at_least_44px`.

BUG-017 — Share button is 30x16px on mobile

Page: /manage-community | **Responsibility:** FRONT

Steps: Open /manage-community at viewport 390x844 and inspect the Share control on a community card. **Expected:** At least 44x44 CSS pixels. **Real:** 30x16px, roughly one third of the required area — it will be frequently mis-tapped. Join (66x42), Leave (77x42) and View (72x42) are marginally short on height and are lower severity. **Evidence:** `test_action_buttons_are_44px`.

LOW

BUG-009 — Clickable elements do not show a pointer cursor on hover

Page: Home, /manage-community | **Responsibility:** FRONT

Steps: Hover over any button — the location selector, the scope switcher, feed filters, Special Section cards, comment and like counters, and on /manage-community the Join, Leave, View, Join Waiting List and Share buttons and the pagination links. **Expected:** `cursor: pointer` on hover. **Real:** 29 buttons on the home page and 19 on /manage-community compute to `cursor: default`. The pagination links "Go to next page" and "Go to previous page" compute to `cursor: auto`. **Evidence:** `test_clickable_elements_have_pointer_cursor`, `test_clickable_have_pointer_cursor`. Likely caused by Tailwind CSS v4, which removed the default `cursor: pointer` on buttons. Fixable globally with a single rule. **Severity note:** filed as Low, but it now affects the primary action buttons (Join, Leave, View, Share). Consider raising to Medium.

BUG-010 — Leftover debug control "Open popover" visible in the UI

Page: Home | **Responsibility:** FRONT

Steps: Scroll to the area directly above the Posts section. **Expected:** No development or debug controls in a deployed build. **Real:** A button labelled "Open popover" is rendered above the Posts section. The label is a framework placeholder rather than product copy. **Evidence:** Visible in the page text output and in the DOM.

Observations — require confirmation from the team

O-1. Content is served from external CDNs. All event images and user avatars load from images.unsplash.com and i.pravatar.cc. Acceptable for a demo build, but this is an external runtime dependency that should not remain in production.

O-2. Community and event data look hardcoded. Dog Owners Community, Game Developers Hub and Boxing Community all show exactly 89.0K members and 21 events.

O-3. Upcoming Events shows past dates. The section lists MAY25, MAY28, JUN02 and JUN05 while the current date is 07.08.2026.

O-4. Duplicate event card. "Hiking & Nature Walk", JUN05, Gurten Bern, 19 going appears twice in a row with different images.

O-5. Contradictory timestamps. A post is labelled "2hr" while showing the absolute date "May 26, 2026" in the same card.

O-6. Pagination is rendered for a single page of results. "Showing 1-6 of 6 communities" is accompanied by "Go to next page" and "Go to previous page" links. Please confirm whether these should be hidden or disabled when there is only one page.

O-7. Language strategy. The `html lang` attribute is present, but there is no language switcher. For a Swiss product DE / FR / IT support will be expected — worth clarifying whether localisation is in scope for this phase.

Recommended fix order

1. **BUG-001** and **BUG-013** — two core flows (creating a post, finding a community) do nothing while appearing to work
2. **BUG-002** and **BUG-014** — filtering and sorting are absent behind a working-looking UI
3. **BUG-015** — 292px horizontal overflow makes the home page unusable on a phone
4. **BUG-003** and **BUG-011** — navigating back out of Manage Communities is broken in every available way
5. **BUG-007**, **BUG-008**, **BUG-016**, **BUG-017** — accessibility group
6. **BUG-004**, **BUG-005**, **BUG-006**, **BUG-009**, **BUG-010** — metadata and styling, cheap to fix in one pass

A common thread across BUG-001, BUG-002, BUG-013 and BUG-014: controls are present and look interactive, but do nothing. This is more damaging than a visibly broken control, because the user receives no signal that their action had no effect.
